Scenario: You are an elderly grandmother. You are having issues remembering to hydrate due to a busy schedule of doting on your grandchildren. You would like to have an app that functions as a reminder to hydrate as well as to keep stats on yourself and your family's hydration.

Task 1: You just drank 10 ounces of coffee. When you drank it you audibly said "Yum". Add the drink to your daily log.

Task 2: Your granddaughter said your username isn't hip anymore. Adjust your username from miriam_atwood to meemaw_miri

Task 3: You drank 12 ounces of green tea last night, but accidentally inputted 12 ounces of black coffee into your daily log. Go to your daily log and adjust the 12 ounces of black coffee to say 12 ounces of green tea.

Notes:
1) What are some changes I would make to the app
    a) Add a tutorial to make it clear to tap water for log.
    b) Make finding settings more intuitive, although the circles make sense.
    c) Perhaps fill in the rest of the circle and don't have more than 5 widgets?
2) What are some things I would keep the same for the app
    a) Everyone liked the circle widgets, so keep those.
    b) Keep the comments for the added liquids.
    c) Everyone liked the name of the app.
